

Theory of Evolution in nutshell

[Anil K. Rajvanshi](#)

In the beginning, space was in equilibrium with time. It was as if time was embedded in it. This space has been called God by Adi Shankaracharya, Ishwar by Patanjali and Purusha by Sankhya. It is similar to what scientists call the event, just before the Big Bang.

Then something happened to disturb the equilibrium and time came out. We still do not know what triggered that. With coming out of time the space started moving since movement cannot happen without time.

This movement of space resulted in eddy formation from which gravity came out and then the process of formation of matter, worlds and life took place. Eddies are small vortex formed when anything flows. These are clearly seen in the flow of water in rivers and canals. In air they give rise to production of drag on airplane and sometimes produce bumpy rides. Formation of eddies is like a new structure formed from the flowing material. These eddies apparently gave rise to the matter and to basic molecules of life which formed the visible world. This is what scientists call as production of matter from vacuum.

The life molecules started becoming more complex and led to life as we know today. The life forms, whose pinnacle glory is human beings, will keep on evolving and lead to entities who can manipulate space dimensions.

This evolution towards manipulating space and dimensions will continue till we would have exhausted dark matter and energy and reach a level where gravity and time will again be sucked back into space and the cycle will continue.
